Metamodeling

(immagini e esempi presi dai tutorial Altair University)

D Fit - Concepts

Metamodeling o superfici di regressione

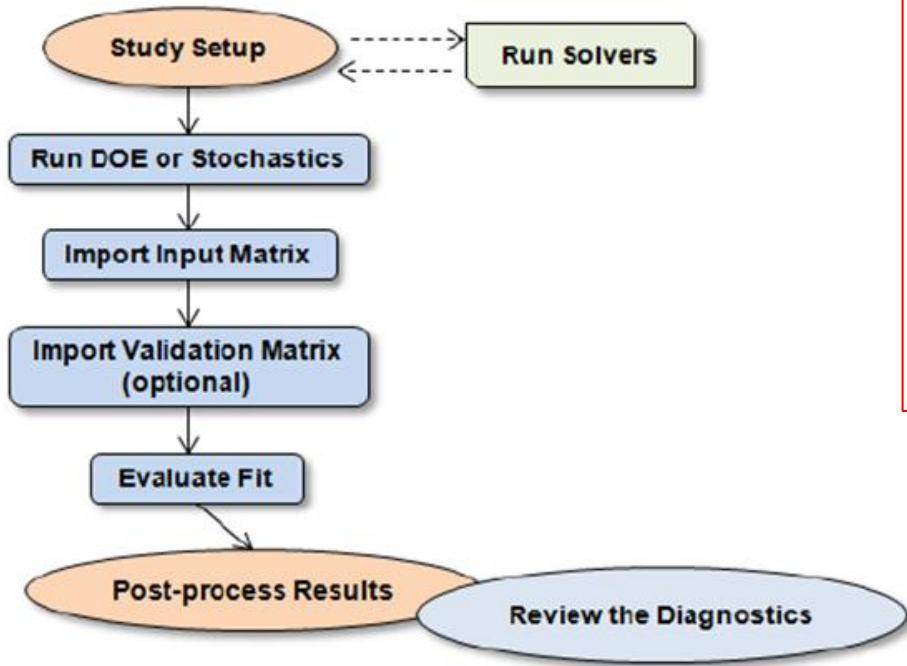

Fitting functions (Approximations) are **meta models** that represent the actual responses.

Why the need for a fit?

- Some simulations are computationally expensive which makes it impractical to rely on them exclusively for design studies. Use of a fit in such cases lead to substantial savings of computational resources.
- Optimization can fall into local minimum or maximum when the responses are nonlinear. Using approximate responses, the user can avoid this issue.

The challenge?

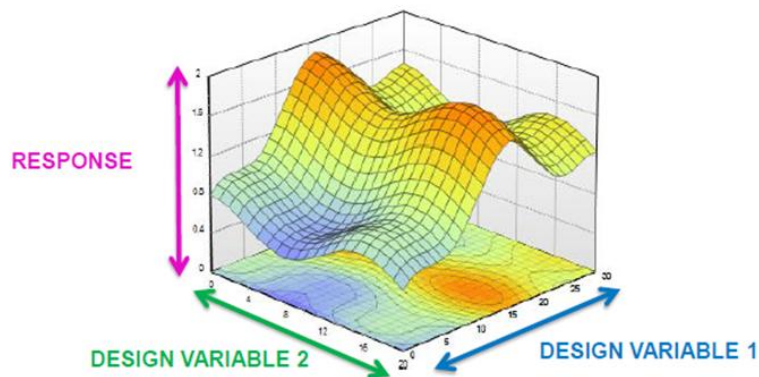

- When using a fit, the issue of a trade off between accuracy and efficiency is ever present.
- The question is how approximate the representation of the design space can be while remaining accurate enough.

Metamodeling - Concetti di base

RSM – Response Surface Method

- RSM techniques were originally developed to analyze experimental data which use **polynomial functions** computed to create **empirical models of the observed response values**
- The particular strength of RSM is its applicability to investigations where there are few observations because the physical experiment is both very expensive and very time consuming to perform.

D Fit - Terminology

- **Regression equation** is the polynomial expression that relates the response of interest to the factors that were varied.
Selection of the proper model is required to create an accurate approximation. However this requires *a-prior* knowledge of the behavior of the responses (linear, non linear, noisy ...) and enough runs to feed the selected model and allow for a successful regression.

- **Linear Regression model**
$$F(X) = a_0 + a_1X_1 + a_2X_2 + (\text{error})$$

- **Interaction Regression Model**
$$F(X) = a_0 + a_1X_1 + a_2X_2 + a_3X_1X_2 + (\text{error})$$

- **Quadratic Regression Model (2nd order)**
$$F(X) = a_0 + a_1X_1 + a_2X_2 + a_3X_1X_2 + a_4X_1^2 + a_5X_2^2 + (\text{error})$$

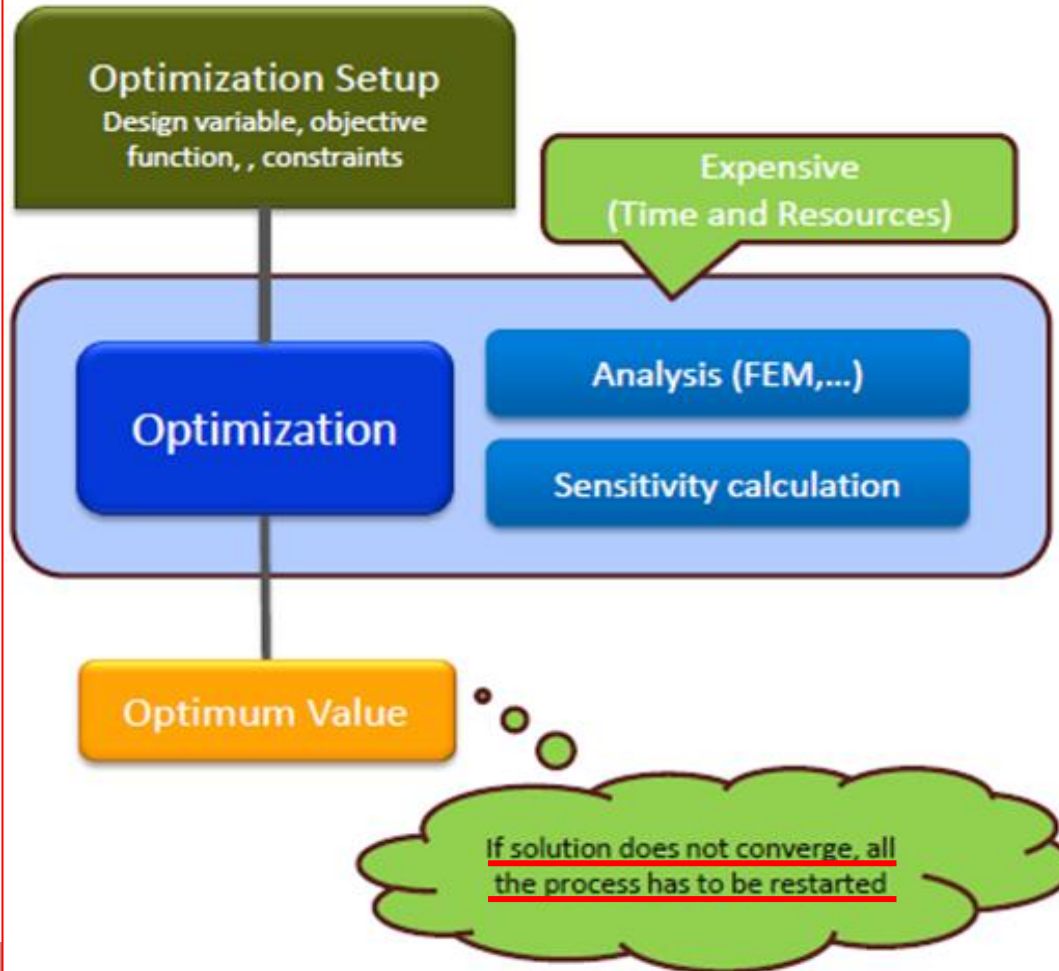

```
Vettore coeff=inv[XTX] XT(vettore run);
XT_1j=1 j=1,...,n
K+1 coefficienti
n run
```

A fit is only as good as the uniformity of the design sampling and, for example, a two-level parameter only has a linear relationship in the regression.

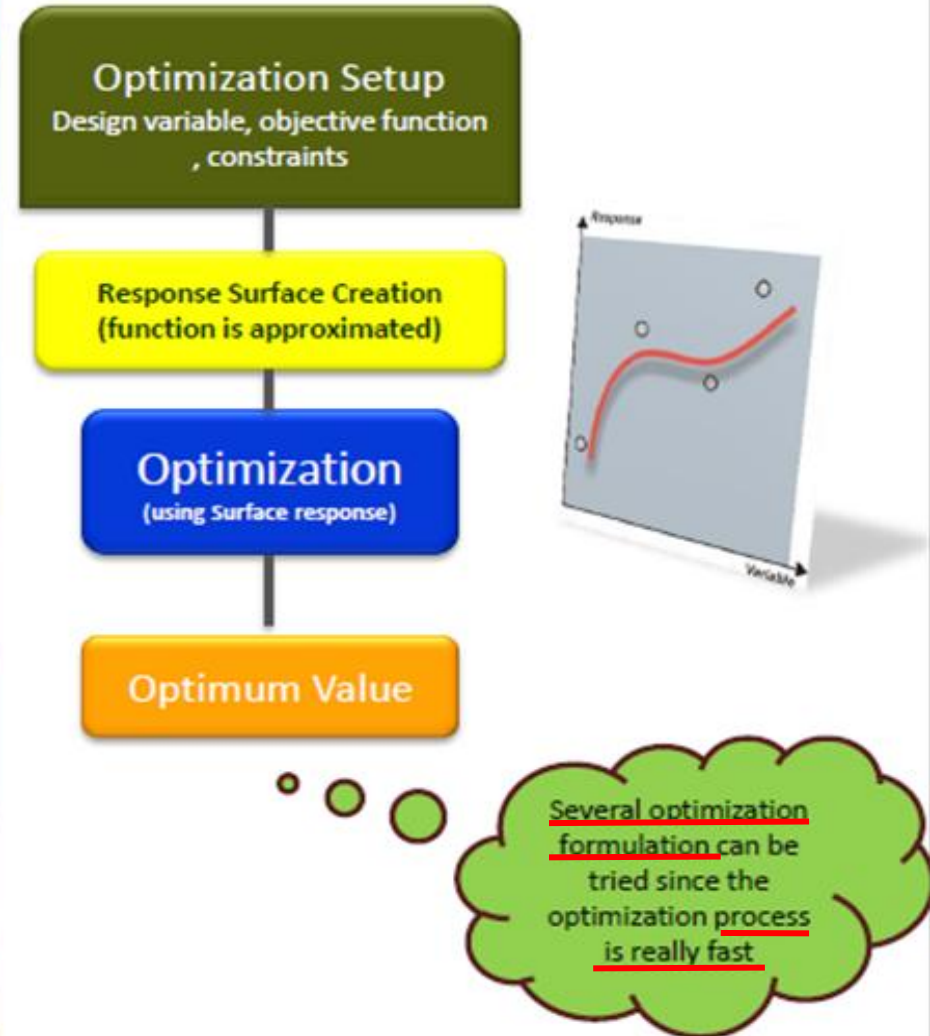

Higher order polynomials can be introduced by using more levels for the factors, but then, using more levels results in more runs.

Metamodeling - Passi logici in HyperStudy

HstApproach_Fit

D Fit - Process

The steps to set up a Fit Approach in HyperStudy are:

1. **Select Matrices (Fit)**
 - Import the run matrix
2. **Select Design Variables**
3. **Select Responses**
4. **Specifications**
 - Methods, Matrix, Regression Terms, Settings
5. **Evaluate**
6. **Post-Processing**
 - Residuals, Diagnostics, Trade-Off 1D, Trade-Off 2D/3D
 - Analysis of Variance (ANOVA, only on **Least Square Regression**)
7. **Report**
 - HTML, HyperWorks
 - Post-Processing
 - Spreadsheet (Fit Excel Plug-In)

Scelta del piano di partenza

D Fit – Select Matrices

This step is only required during a **Fit** approach.

Select matrices allows you to import and modify the design matrices and associated results for the creation of the approximation model. The matrix and results should be imported from an existing DOE or Stochastic approach and can be further edited on the fly.

Fit can import two types of matrices:

- **Input matrices:** the data will be used to create the fit and tune its parameters
- **Validation matrices:** the data will be used to assess the quality of the fit.

	Specifications	Input Matrix	Validation Matrix	Regression Terms				
	Include	Thickness	H2	I1	I2	Mass	Disp	Freq
1	<input checked="" type="checkbox"/>	0.0023750	-0.5000000	-0.5000000	-0.5000000	2.2165600	0.0027033	322.54180
2	<input checked="" type="checkbox"/>	0.0023750	-0.5000000	-0.5000000	0.5000000	2.4824000	0.0015447	351.47020
3	<input checked="" type="checkbox"/>	0.0023750	-0.5000000	0.5000000	-0.5000000	2.4695000	0.0023253	300.41670
4	<input checked="" type="checkbox"/>	0.0023750	-0.5000000	0.5000000	0.5000000	2.7342300	0.0013569	325.26170
5	<input checked="" type="checkbox"/>	0.0023750	0.5000000	-0.5000000	-0.5000000	2.3873400	0.0022789	415.00990

D Fit – Select Matrices

- 1) Click **Add Matrix** button
- 2) In the **HyperStudy - Add** dialog, enter a label for the matrix in the **Label** field.

- 3) Click **Apply** or **OK** according to your needs
- 4) Once you add a matrix, define the following fields:

Active	Label	Varname	Type	Matrix Source	Matrix Origin	Status
<input checked="" type="checkbox"/>	FitMatrix 1	fitmatrix_1	Input	Optimization 1 (opt_1)	OptStudyOptimization 1	Import Pending
<input checked="" type="checkbox"/>	FitMatrix 2	fitmatrix_2	Input	Optimization 1 (opt_1)	OptStudyOptimization 1	Import Pending
<input checked="" type="checkbox"/>	FitMatrix 3	fitmatrix_3	Input	Optimization 3 (opt_3)	OptStudyOptimization 3	Import Pending

- 5) Click **Import Matrix** button to import the data from the matrix(es).

- **Regression Terms:** If the imported matrices contain failed runs, the corresponding lines are made inactive the data will be used to assess the quality of the fit.

	Specifications	Input Matrix	Validation Matrix	Regression Terms
	Active	Coefficient	Terms	
1	<input checked="" type="checkbox"/>	a0	intercept	
2	<input checked="" type="checkbox"/>	a1	dv_1^1	
3	<input checked="" type="checkbox"/>	a2	dv_2^1	

D Fit – Select Design Variables

This step is similar across the four approaches with the following exceptions.

For a **Fit**, you can:

- Select the design variables against which the approximation will be built. The design variables shown in the table in the work area are derived from the design variables present in the matrices (see **Select Matrices**, To import a design matrix). Some variables can be removed from the default table.

	Active	Label	Varname	Lower Bound	Initial	Upper Bound
1	<input checked="" type="checkbox"/>	Thickness	m_1_Thickness	0.0015000	0.0020000	0.0025000
2	<input checked="" type="checkbox"/>	H2	m_1_H2	-1.0000000	0.0000000	1.0000000
3	<input checked="" type="checkbox"/>	I1	m_1_I1	-1.0000000	0.0000000	1.0000000
4	<input checked="" type="checkbox"/>	I2	m_1_I2	-1.0000000	0.0000000	1.0000000

D Fit – Select Responses

Review your responses and exclude any of the responses from the approach by un-checking the response in the State column.

It is not possible to exclude responses in an optimization approach.

You can also change the evaluation source from its default entry of SOLVER to one of the Fits (if you have any Fit approaches defined prior to this approach).

	Active	Label	Varname	Expression	Evaluate From
1	<input checked="" type="checkbox"/>	Mass	r_1	v_1[0]	Mass_MLSM (r_1_fit_5)

D Fit – Specifications Methods

Fits methods:

- Least Squares Regression (LSR)
- Moving Least Squares Method (MLSM)
- HyperKriging (HK)
- Radial Basic Function (RBF)

Mode	Label	Vorname	Details
1	Least Squares Regression	LSR	
2	Moving Least Squares	MLSM	
3	HyperKriging	HK	
4	Radial Basis Function	RBF	

Automatic Build

Confidence 95.000000

Order 1

Settings

In the **Input Matrix** and **Validation Matrix** tabs, the matrices selected when creating the **Fit** approach are displayed. The tables can be reviewed, and the values in the cells can be edited. Some lines can be removed from the selection. If the imported matrices contain failed runs, the corresponding lines are made inactive.

D Fit - Least Squares Regression (LSR)

LSR method creates a regression polynomial of the chosen order such that the sum of the squares of the differences (residuals) between response values predicted by the regression model and the corresponding simulation model is minimized.

- Usability Characteristics → HyperStudy will create the least squares regression of any order
- Settings →

Mode	Label	Varname	Details	Value
1	Least Squares Regression	LSR		Automatic Build <input type="checkbox"/>
2	Moving Least Squares	MLSM		Confidence 95.000000
3	HyperKriging	HK		Order 1
4	Radial Basis Function	RBF		

Can be any polynomial order, differentiator for HyperStudy

Can turn on/off, differentiator for HyperStudy.
If you want a higher order polynomial but do not have enough runs, can turn off the ones you think are not significant (very high order terms; high order interactions)

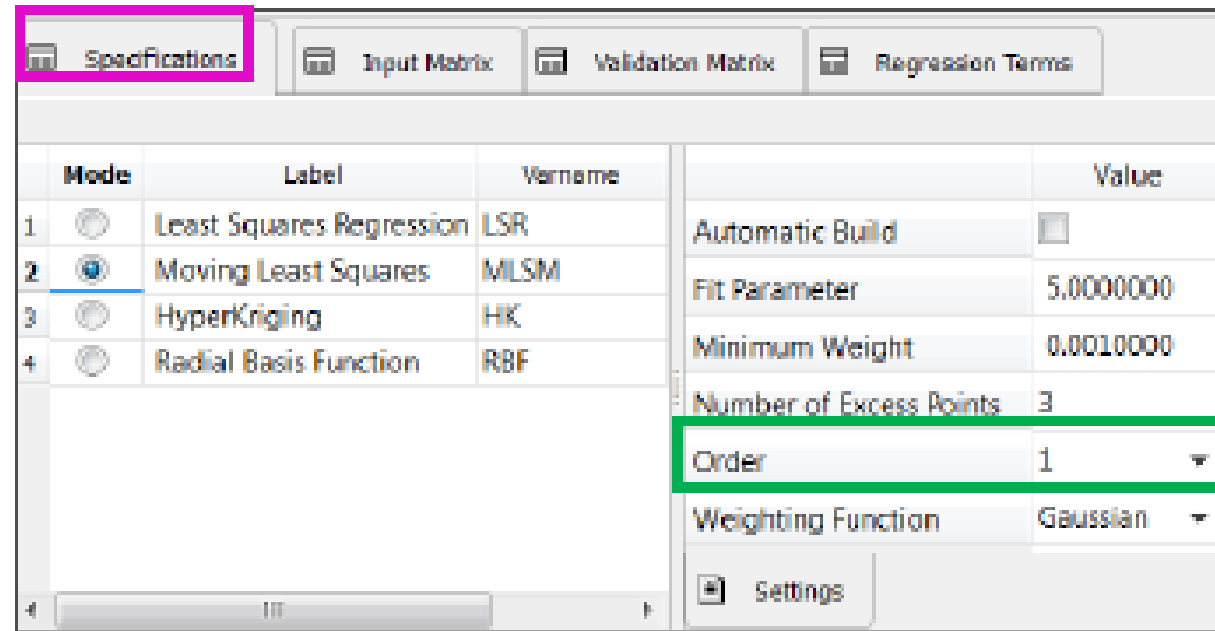

Active	Coefficient	Terms
<input checked="" type="checkbox"/>	a0	intercept
<input checked="" type="checkbox"/>	a1	m_1_Thickness^1
<input checked="" type="checkbox"/>	a2	m_1_H2^1
<input checked="" type="checkbox"/>	a3	m_1_I1^1
<input checked="" type="checkbox"/>	a4	m_1_I2^1

Label	Varname	Category
1 Mass	r_1	Response
2 Disp	r_2	Response
3 Freq	r_3	Response

D Fit - Moving Least Squares Method (MLSM)

MLSM builds a weighted least squares model where the weights associated with the sampling points do not remain constant. They are functions of the normalized distance from a sampling point to a point x , where the surrogate model is evaluated. The weight, associated to a sampling point, decays (decay function) as the evaluation point moves away from it. For each point x it reconstructs a continuous function biased towards the region around that point.

- Usability Characteristics → Suggested to be used for non-linear and noisy responses.
- Settings →

Mode	Label	Vname	Value
1	Least Squares Regression	LSR	Automatic Build <input type="checkbox"/>
2	Moving Least Squares	MLSM	Fit Parameter 5.0000000
3	HyperKriging	HK	Minimum Weight 0.0010000
4	Radial Basis Function	RBF	Number of Excess Points 3
			Order 1
			Weighting Function Gaussian

Settings

Scelta dei metodi di fitting – Moving Least Squares Method

Scelta dei metodi di fitting – Kriging

D Fit - HyperKriging (HK)

HyperKriging is a HyperStudy implementation of an approximation model building technique known as Kriging. Kriging was originally developed in the field of geostatistics and is attributed to the development of statistical techniques by mining engineer D.G. Krige. It is also known as Design and Analysis of Computer Experiments (DACE), which emphasizes that it models deterministic computer simulations.

- Usability Characteristics → Suitable for modeling highly nonlinear response data that does not contain numerical noise.

Least squares quadratic regression

Kriging model

- Settings →

Mode	Label	Varname	Value

2	Moving Least Squares	MLSIM	
3	HyperKriging	HK	
4	Radial Basis Function	RBF	

Automatic Build

Settings

Scelta dei metodi di fitting – Radial Basis Functions

D Fit - Radial Basis Functions (RBF)

RBF method is a Fit method that uses linear combinations of basis functions. Typical basis functions are linear, cubic, thin-plate spline, Gaussian, multiquadric, and inverse-multiquadric. These basis functions are observed to be accurate for highly nonlinear responses but not for linear responses. To remedy this deficiency, in HyperStudy, a RBF model is augmented with a polynomial function:

$$f(x) = \sum_{i=1}^n \lambda_i \phi(\|x - x_i\|)$$

- Usability Characteristics → RBF tries to go through the exact sampling points, and in general, the residuals are small, if not zero.
- Settings →

Mode	Label	Yorname	Value
1	Least Squares Regression	LSR	Augmented Function: Constant
2	Moving Least Squares	MLSM	Automatic Build: <input type="checkbox"/>
3	HyperKriging	HK	Maximum Points: 2000
4	Radial Basis Function	RBF	RBF Type: CS21
			Relaxation Parameter: 1.0000000

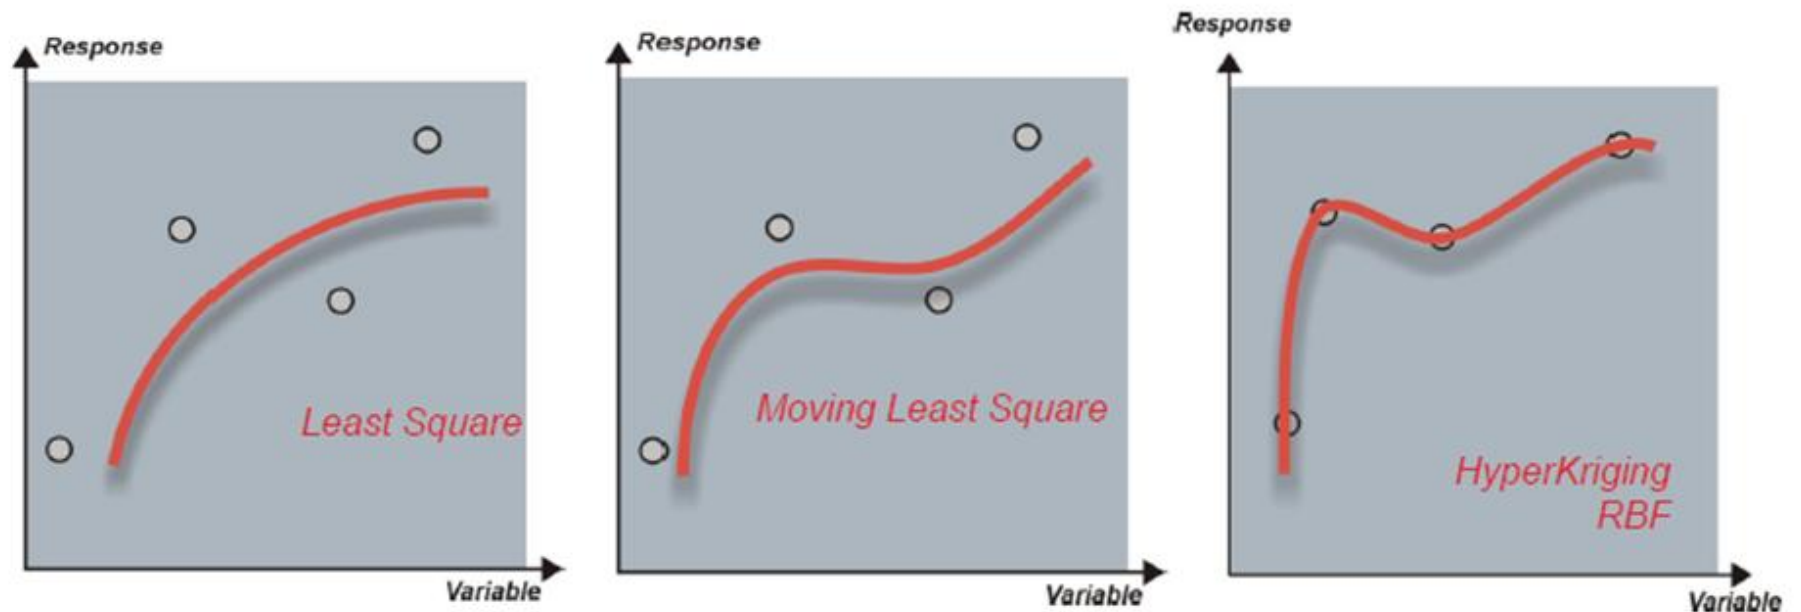

Scelta dei metodi di fitting – confronto

D Fit – Specifications Methods Summary

Type	Equation Available	Application
Least Square Regression	Yes	Nonlinear (e.g. second order) with noise
Moving Least Squares	No	Highly non-linear behavior with noise
HyperKriging	No	Highly non-linear behavior without noise
Radial Basis Functions	No	Highly non-linear behavior without noise

Come si vede Kriging è un metodo interpolante, quindi è conforme al DACE

Postprocessing

D Fit - Post-Processing

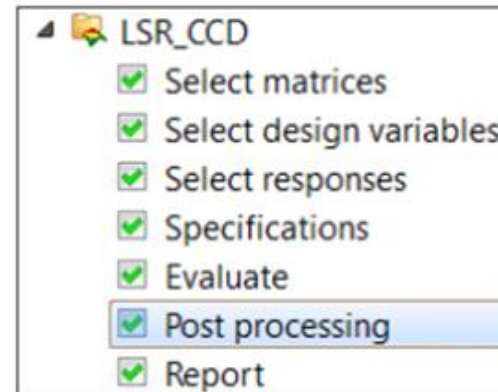

Post processing options for the approaches of a study are split into two groups; one group is available regardless of approach, and another group provides approach-specific options.

Run Summary, Statistics, Histogram, Box Plot and the **Scatter plots (2D and 3D)** are available across all approaches. Any approach-specific post processing options will appear in a second group of tabs.

The Fit-specific **Post-Processing** includes **Residuals, Diagnostics, Trade-Off 1D, Trade-Off 2D/3D** and **Analysis of Variance (ANOVA)**.

In the **Explorer** select *Post-processing* step, **Post processing** to proceed with Fit Post-Processing.

- Run Summary

Fit - Post-Processing

Diagnostics

Diagnostics help in the assessment of the accuracy of the approximate model.

R-Square, **R-Square Adjusted** and **Multiple R** are statistical terms indicating the accuracy of the approximations:

- **R-Square** predicts how well a regression approximates real data points.
- **R-Square Adjusted** is a modification of R-Square that takes number of data points into account. Unlike R-Square, R-Square Adjusted increases only if the new term improves the model more than would be expected by chance. It can be negative and will always be less than or equal to R-Square.
- **Multiple R** is the correlation coefficient. It indicates relationship between the approximation and the data.

Criteria	Input Matrix	Validation Matrix
1. R-Square	0.9961770	0.8411671
2. R-Square Adjusted	0.9954124	
3. Multiple R	0.9980866	0.9171516
4. Regression Equation	358.93248+...	
5. Relative Average Absolute Error	0.0505462	0.2220029
6. Maximum Absolute Error	6.5883847	42.831208
7. Root Mean Square Error	3.0448170	19.309455
8. Number of Samples	25	5

Active	Coefficient	Terms	Lower	Values	Upper	T-value	
1	<input checked="" type="checkbox"/>	a0	intercept	354.43914	359.93749	365.43584	134.85340
2	<input checked="" type="checkbox"/>	a1	m_1_Thickness^1	3841.3827	3849.5619	3857.7411	960.54349
3	<input checked="" type="checkbox"/>	a2	m_1_HZ^1	88.928077	91.790800	94.653523	66.052171
4	<input checked="" type="checkbox"/>	a3	m_1_I1^1	-29.373439	-26.510717	-23.647994	-19.070971
5	<input checked="" type="checkbox"/>	a4	m_1_I2^1	26.978561	29.841283	32.704306	21.473629

Range for coefficients for the corresponding confidence limit
 We have 95% confidence that the intercept value is between ~40 and ~80.

The difference between the response value from the solver and the response value from the response surface is the error, or the residual. The residual plot can be used to determine which runs are generating more error in the model.

D Fit - Post-Processing

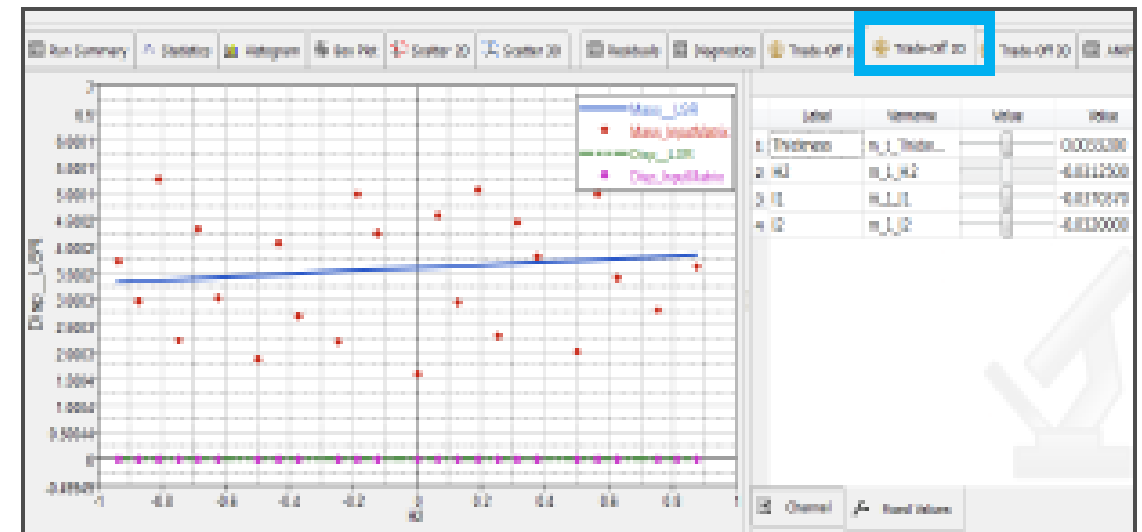

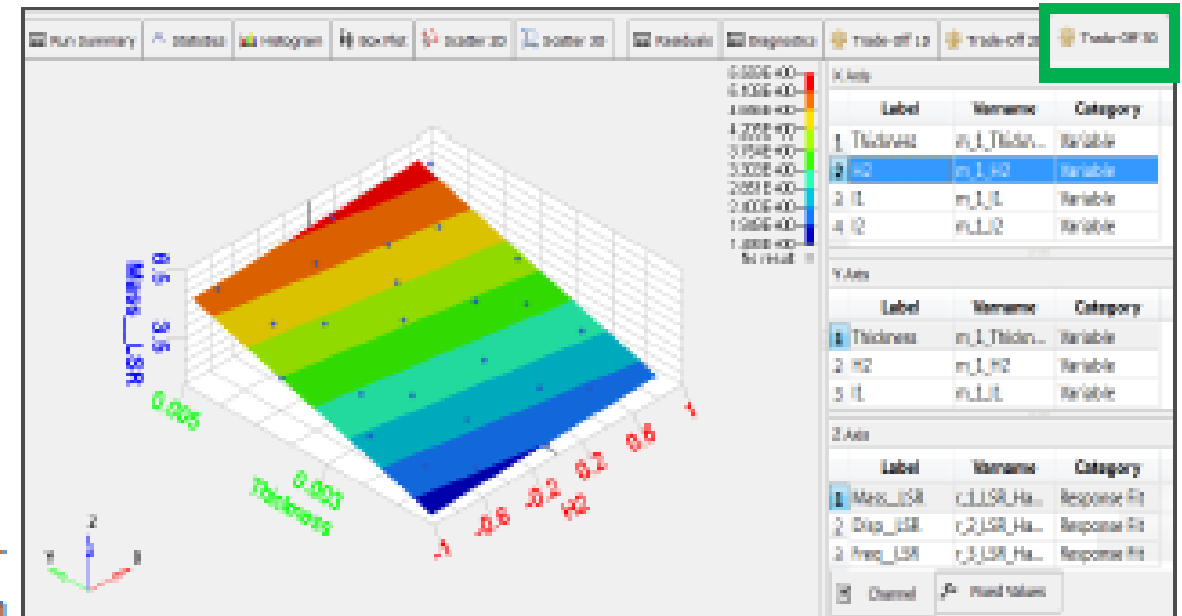

Trade-Off 2D/3D

The Trade-Off 2D/3D tabs are an extension of the Trade-Off 1D tab.

In both of these tabs:

- Responses are selected in the Channel tab (right-hand panel).
- Variables are modified using the Fixed Values tab (right-hand panel). The sliders in the Value column, can be used to modify the other design variables, while studying the response throughout the design space.
- Displays plots of response vs. design variables.

D Fit - Post-Processing

Analysis of Variance (ANOVA)

ANOVA is a useful technique for estimating error variance and for determining the relative importance of various factors.

In HyperStudy, the ANOVA is performed only on Least Square Regression.

The ANOVA is plotted as the Percentage contribution of each design variable, the interaction and the Error.

The following quantities are computed in the process of performing the ANOVA:

DoF	- Degrees of freedom, Number of terms in the approximation.
SS	- Sum of Square
MSS	- Mean sum of squares ($MSS = SS/DoF$)
%	- Percentage contribution.
F0	- F0 value ($F0 = MSS(Variable)/MSS(Error)$).

Variables	Degree Of Freedom	Sum Of Squares	Mean Squares	Mean Squared Percent	F Value
1 m_1_Thickness	1	21.619055	21.619055	92.131113	4793.2620
2 m_1_H2	1	0.3292243	0.3292243	1.4030124	72.993865
3 m_1_I1	1	0.7181368	0.7181368	3.0603903	159.22148
4 m_1_I2	1	0.7946048	0.7946048	3.3862636	176.17554
5 Error	20	0.0902060	0.0045103	0.0192210	N/A
6 Total	24	23.551227	N/A	100.00	N/A

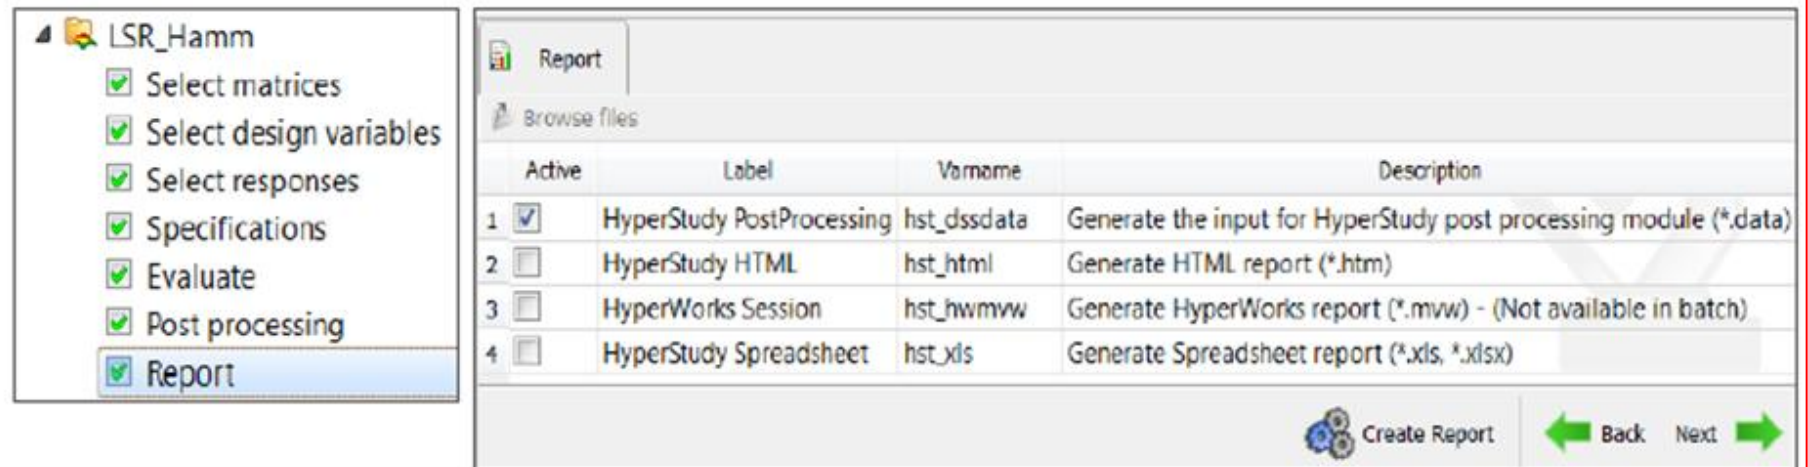

D Fit - Reporting

Reporting

There are currently four reporting options for all approaches:

- **HTML** - Generates a HTML report and opens it in your default web browser
- **HyperWorks** - Generates a HyperWorks report and opens it in HyperWorks Desktop.
- **Post-Processing** tool (review help) - Launches the post-processing and data mining tool
- **Spreadsheet** - Generates a spreadsheet report and opens it in Excel. For a Fit approach, Trade-off 1D post-processing can be reported to Excel spreadsheets, which allows you to do trade-off studies in Excel, independent of HyperStudy. For more information on this feature, refer to *Fit Excel Plug-In*.

In the **Explorer** select *Report* step **Report** , to proceed with Fit Reporting.

The screenshot shows the software interface for the 'Report' step. On the left, a tree view under 'LSR_Hamm' shows several steps with checkboxes, and 'Report' is selected. On the right, a table lists the reporting options with their respective labels, varnames, and descriptions.

Active	Label	Varname	Description
<input checked="" type="checkbox"/>	HyperStudy PostProcessing	hst_dssdata	Generate the input for HyperStudy post processing module (*.data)
<input type="checkbox"/>	HyperStudy HTML	hst_html	Generate HTML report (*.htm)
<input type="checkbox"/>	HyperWorks Session	hst_hwmvw	Generate HyperWorks report (*.mww) - (Not available in batch)
<input type="checkbox"/>	HyperStudy Spreadsheet	hst_xls	Generate Spreadsheet report (*.xls, *.xlsx)

At the bottom right of the interface, there are buttons for 'Create Report', 'Back', and 'Next'.

D Fit - Reporting

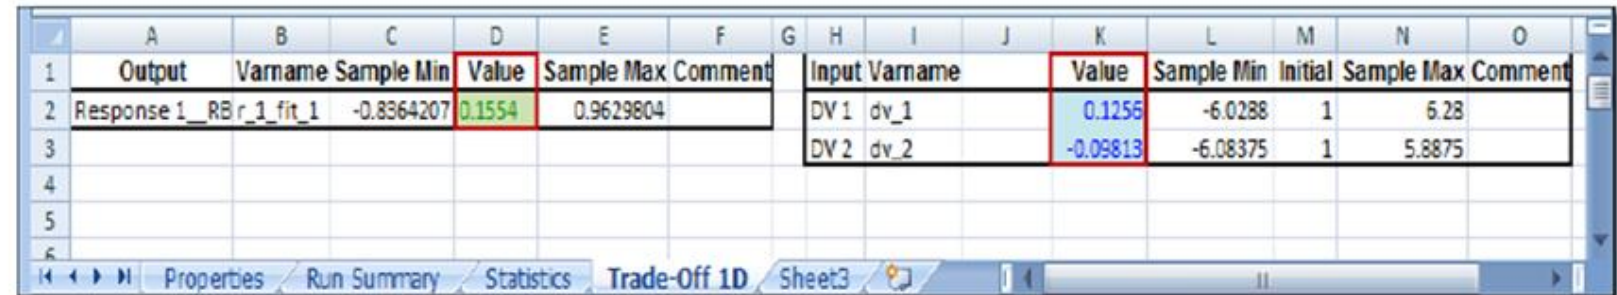

Reporting (...continue)

- **Fit Excel Plug-In**

For a **Fit** approach, you can generate a **Trade-off 1D** post-processing report to **Excel** spreadsheets. This specific report allows you to do trade-off studies in Excel, independent of HyperStudy. In order to use this feature, you add the HstAddinFit add-in to Excel.

Fit Excel report: Trade-Off 1D tab is a reflection of the corresponding **Trade-Off 1D** tab (HyperStudy). From the Trade-Off 1D tab in Excel, you can adjust the design variable values on the right-hand side to change the predicted responses values displayed on the left-hand side.

- 1) Select the *HyperStudy Spreadsheet* check box.
- 2) Click *Create Report*. HyperStudy generates an Excel report and opens it in Excel.
- 3) In the Excel report, click the *Trade-Off 1D* tab.

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
1	Output	Varname	Sample Min	Value	Sample Max	Comment		Input	Varname		Value	Sample Min	Initial	Sample Max	Comment
2	Response1_RBr_1_fit_1		-0.8364207	0.1554	0.9629804			DV 1	dv_1		0.1256	-6.0288	1	6.28	
3								DV 2	dv_2		-0.09813	-6.08375	1	5.8875	
4															
5															
6															

- 4) To verify that the same values occur in the response prediction columns for the same set of design variables, simultaneously adjust the values within HyperStudy and the Excel report.

D Fit - Exercise 3a

Input file:

This exercise uses the completed study from Exercise 2b, Study_2b_complete.xml. Alternatively, you can begin from a file in the tutorials set, Study_3a, Study-3A-BASE-FILES (Study-3A-base-files-archive.hstx).

Goal:

To create an approximation from DOEs performed in HyperStudy. The quality of the DOE and inputs to the approximation will determine the amount of error in the resulting approximation surface.

Variables:

PSHELL Thickness, Shapes, H2, I1, I2

Define Fits:

Create Fits and compare the error and the quality of the approximation for each method

Responses:

[No responses for this exercise]

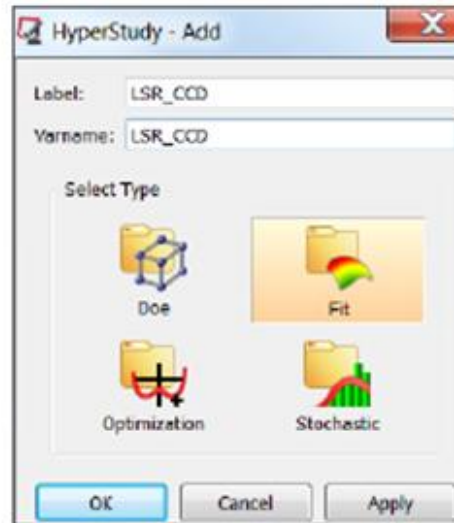

D Fit - Exercise 3a Major Steps

1) Open the existing study within HyperStudy (**Study-3a-base-files-archive.hstx**)

	Label	Varname	Type
1	Setup	nom_1	HstApproach_Nom
2	FullFact3L_2187	doe_1	HstApproach_Doe
3	FullFact2L_128	doe_2	HstApproach_Doe

5	CentralComposite	doe_4	HstApproach_Doe
6	Hammersley	Hammersley	HstApproach_Doe
7	LH5	LH5	HstApproach_Doe

2) Add new Fit (Approximations) to the study

a) Fit (Approximation): Select matrices

	Active	Label	Varname	Type	Matrix Source	Matrix Origin	Status
1	<input checked="" type="checkbox"/>	FitMatrix 1	fitmatrix_1	Input	CentralComposite (doe_4)	DoeStudyCentralComposite	Import Pending
2	<input checked="" type="checkbox"/>	FitMatrix 2	fitmatrix_2	Validation	LH5 (LH5)	DoeStudyLH5	Import Pending

D Fit - Exercise 3a

2) Add new Fit (Approximations) to the study

b) Fit (Approximation): Select design variables and Responses

Define design variables						
Add Design Variable Remove Design Variable						
Active	Label	Varname	Lower Bound	Initial	Upper Bound	Comment
<input checked="" type="checkbox"/>	Thickness	m_1_Thickness	0.0015000	0.0020000	0.0050000	...
<input checked="" type="checkbox"/>	H2	m_1_H2	-1.0000000	0.0000000	1.0000000	...
<input checked="" type="checkbox"/>	I1	m_1_I1	-1.0000000	0.0000000	1.0000000	...
<input checked="" type="checkbox"/>	I2	m_1_I2	-1.0000000	0.0000000	1.0000000	...

Select responses			
Add Response Remove Response			
Active	Label	Varname	Expression
<input checked="" type="checkbox"/>	Mass	r_1	v_1[0] ...
<input checked="" type="checkbox"/>	Disp	r_2	v_2[0] ...
<input checked="" type="checkbox"/>	Freq	r_3	v_3[0] ...

c) Run Fit (Approximation): *Specifications* → *Mode* tab, choose Least Squares Regression

Input Matrix tab, **Include** column, set all flag on

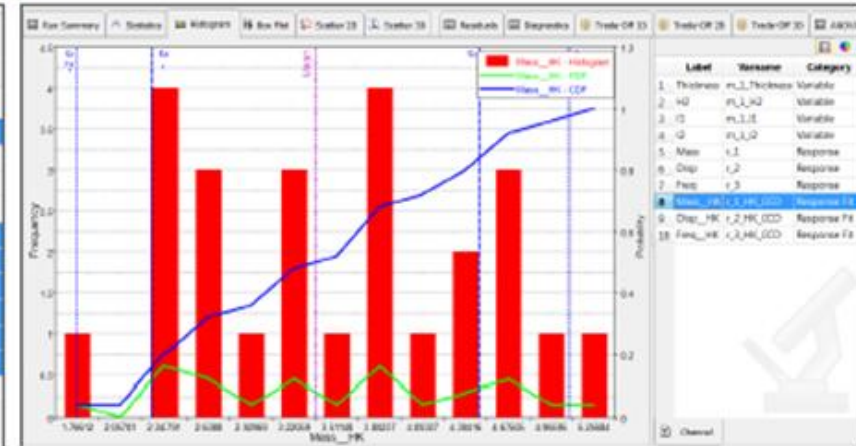

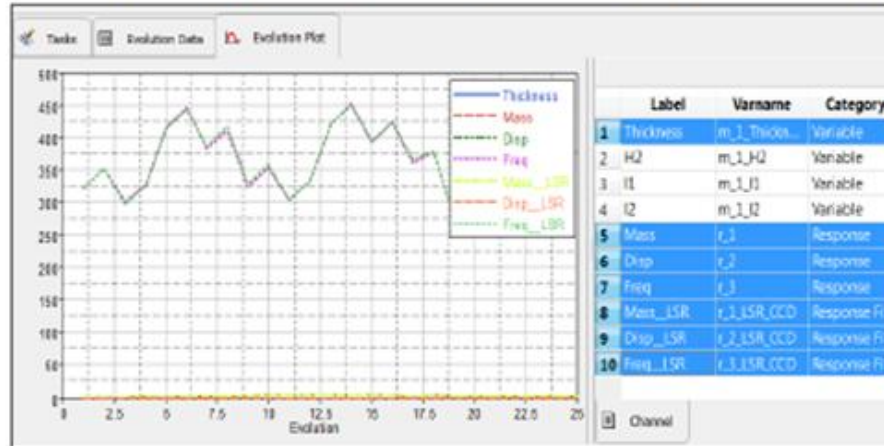

Specifications				
Mode	Label	Varname	Details	Value
<input checked="" type="radio"/>	Least Squares Regression	LSR		Automatic Build <input type="checkbox"/>
<input type="radio"/>	Moving Least Squares	MLSM		Confidence 95.000000
<input type="radio"/>	HyperKriging	HK		Order 1
<input type="radio"/>	Radial Basis Function	RBF		Settings

Specifications							
Include	Thickness	I2	I1	I2	Mass	Disp	Freq
<input checked="" type="checkbox"/>	0.0023750	-0.5000000	-0.5000000	-0.5000000	2.2165600	0.0027033	322.54180
<input checked="" type="checkbox"/>	0.0023750	-0.5000000	-0.5000000	0.5000000	2.4824000	0.0015447	351.47020
<input checked="" type="checkbox"/>	0.0023750	-0.5000000	0.5000000	-0.5000000	2.4695000	0.0023253	300.41670
<input checked="" type="checkbox"/>	0.0023750	-0.5000000	0.5000000	0.5000000	2.7342300	0.0013569	325.26170

D Fit - Exercise 3a

2) Add new Fit (Approximations) to the study

d) Fit (Approximation): Evaluate and Post-Processing

3) Add 5 more Fit to the study with the following table

Label	Approximation Type
MLSM_CCD	Moving Least Squares Method
HK_CCD	HyperKriging
LSR_Hamm	Least Squares Regression
MLSM_Hamm	Moving Least Squares Method
HK_Hamm	HyperKriging

Label	Varname	Type	
1	Setup	nom_1	HstApproach_Nom
2	FullFact3L_2187	doe_1	HstApproach_Doe
3	FullFact2L_128	doe_2	HstApproach_Doe
4	FracFact3L_27	doe_3	HstApproach_Doe
5	CentralComposite	doe_4	HstApproach_Doe
6	Hammersley	Hammersley	HstApproach_Doe
7	LH5	LH5	HstApproach_Doe
8	LSR_CCD	LSR_CCD	HstApproach_Fit
9	MLSM_CCD	MLSM_CCD	HstApproach_Fit
10	HK_CCD	HK_CCD	HstApproach_Fit
11	LSR_Hamm	LSR_Hamm	HstApproach_Fit
12	MLSM_Hamm	MLSM_Hamm	HstApproach_Fit
13	HK_Hamm	HK_Hamm	HstApproach_Fit

D Fit - Exercise 3a

4) Fit (Approximation): setting changes (Type and Responses)

- Select Fit «LSR_Hamm», select *Hammersley* DOE as Matrix source and Run it.
- Set the other Fits according to the following table:

Fit Label	Specification (Approximation Mode)	Responses (flag on only)	Matrix Source (Import Doe)
MLSM_CCD	Moving Least Squares Method	All	Central Composite
HK_CCD	HyperKriging	All	Central Composite
LSR_Hamm	Least Squares Regression	Mass, Displacement, Frequency	Hammersley
MLSM_Hamm	Moving Least Squares Method	Mass, Displacement, Frequency	Hammersley
HK_Hamm	HyperKriging	Mass, Displacement, Frequency	Hammersley

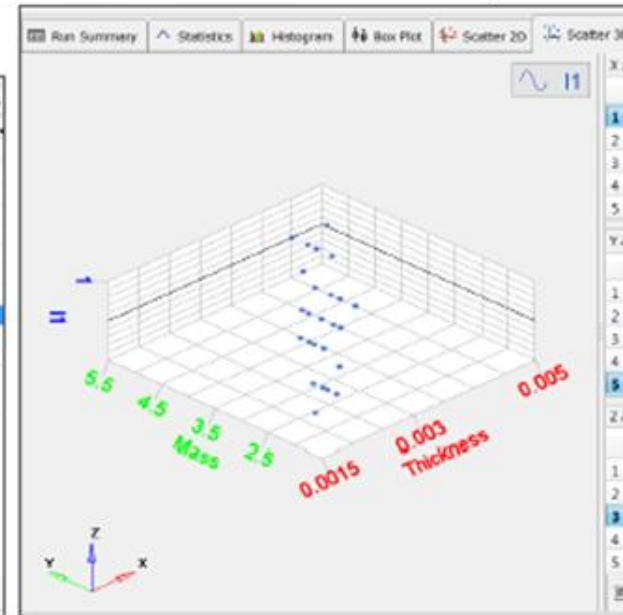

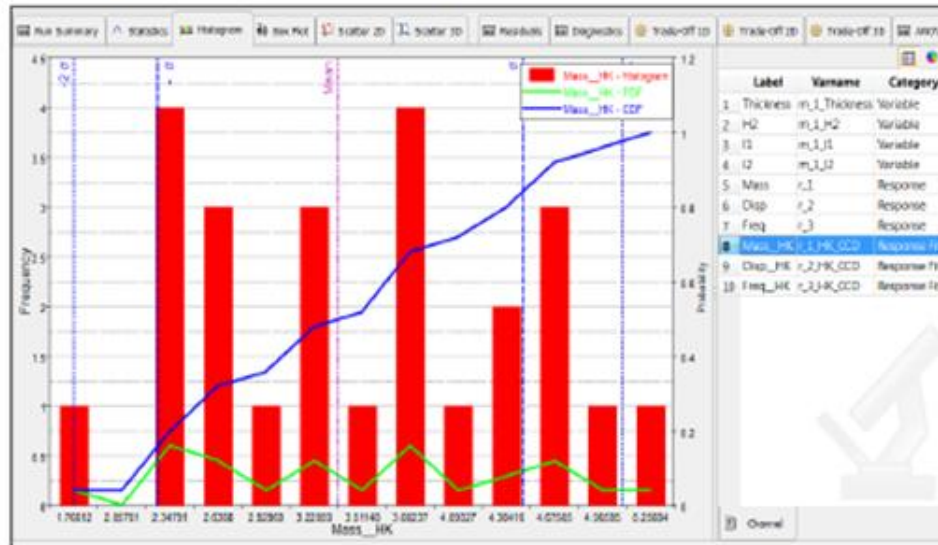

- Select the best method (Compare the error and the quality of the approximation for each method)

5) Post Process the Fits

a) Residuals

	Thickness	H2	I1	I2	Freq	Freq_HK	Error	Percent Error
1	0.0023750	-0.5000000	-0.5000000	-0.5000000	322.54180	322.54096	8.40e-04	2.60e-04

b) Scatter 3D & Histograms

5) Post Process the Fits

c) Trade-Off 1D

- Trade-Off is available only if you flag on the "Autobuild" option in the Specifications tab.

6) Save the Study
