

QUESTIONARIO TIPO 2 - ESERCIZI

Controllo delle scorte, MRP, Scheduling

3.0

In un sistema sono presenti un certo numero di job che debbono essere processati utilizzando al massimo le uniche 3 macchine disponibili: un tornio(A) una fresatrice (B) ed una rettificatrice (C). Tuttavia, non tutti i job richiedono l'impiego delle tre macchine indicate . Lo schema produttivo da rispettare è riportato nella seguente tabella:

Job	M1	M2	M3
1	6	-	4
2	2	-	1
3	4	-	7
4	5	-	3
5	7	-	4
6	3	-	1
7	-	4	6
8	-	2	10
9	-	6	9
10	-	8	2

Dovendo avviare la produzione complessiva, si stabilisca per ciascuna delle tre macchine la sequenza ottimale da impiegare.

Calcolare il Makespan complessivo e mostrare i tempi di inattività (idle-times):

Macchina A

Macchina B

Macchina C

3.0

Si consideri la rete di Jackson riportata in basso. Essa rappresenta un sistema di lavorazione costituito da 3 stazioni A, B, C ciascuna con un solo servente. A è una stazione di lavorazione in cui i pezzi arrivano con distribuzione esponenziale di parametro $\lambda = 15$ pezzi/ora, B è una stazione di ispezione destinata solo per i pezzi a geometria complessa, mentre C è una stazione di verniciatura. Determinare la velocità produttiva a cui è possibile impostare le macchine. [Si ipotizzi che tutti i sistemi di code siano M/M/1 e che il regime sia raggiunto].
